Notes & suggested improvements

- The dashboard uses your project's `Broker` wrapper; if `MODE=ALPACA` and keys present it uses **Alpaca Paper**.
- Improvements you may want:
 - Persist trades in a SQLite DB (you already have `quantbot.db`) and show historical P&L.
 - Add position sizing options: risk-per-trade (% of equity).
 - Add order types: limit vs market, stop-loss / take-profit.
 - Add a streaming live price feed (websockets) for near-real-time execution.
 - Add authentication for deploying dashboard to a server.
 - Add selectable strategy parameters (SHORT, LONG, ALLOC_PCT) from UI and save them.
